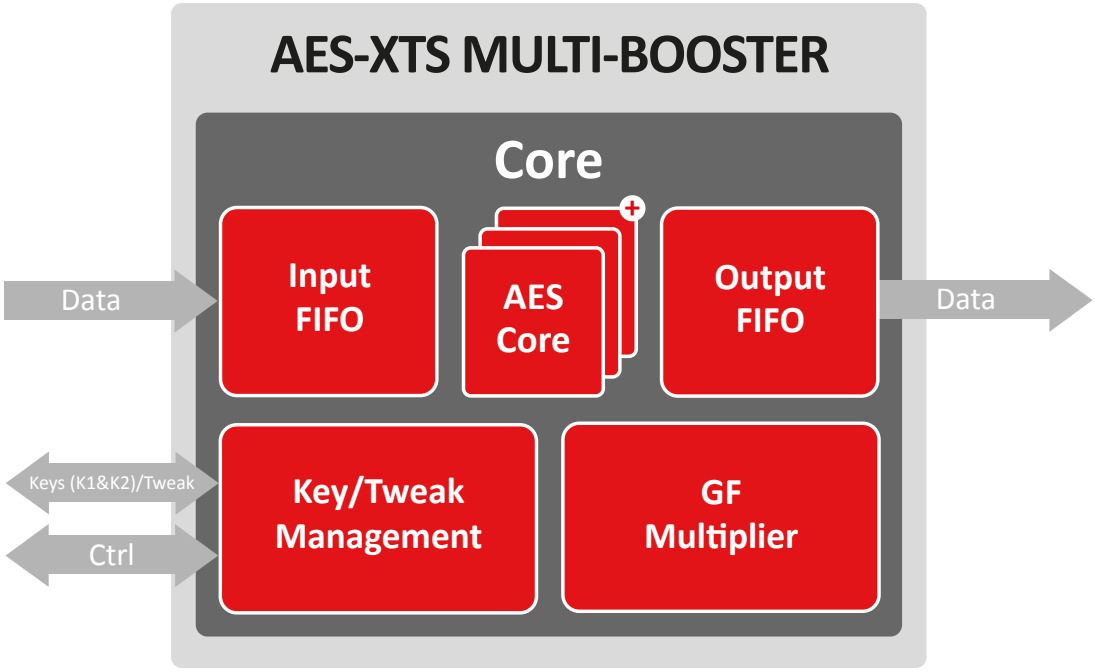
AES-XTS MULTI-BOOSTER

The AES-XTS Multi-Booster crypto engine includes a generic & scalable implementation of the AES algorithm making the solution suitable for a wide range of low-cost & high-end applications (including key, tweak, input and output registers and Galois field multiplier).

This crypto engine targets high-performance applications, where a high throughput is required. Thanks to its scalability, it can be tailored to reach the best trade-off between performances, area and technology.



Implementation aspects

The AES-XTS crypto engine is easily portable to ASIC and FPGA . It supports a wide range of applications on various technologies. The unique architecture enables a high level of flexibility. The throughput and features required by a specific application can be taken into account in order to select the most optimal and compact configuration.

Features

- ASIC & FPGA
- High throughput:
  - ASIC: 2Tbps
  - FPGA: 100 Gbps
- Masking option available with excellent protection against SPA & DPA
- 128-bit and 256-bit key
- NIST SP 800-38D compliant
- Scalable solution
- Can be provided with AXI DMA & software
- Cipher stealing (optional)
- Low power feature
- Best trade-off between area and performance
- Straight forward integration with simple FIFO interfaces

Applications

- Encrypted disk/data storage
- SATA III

Deliverables

- Netlist or RTL
- Scripts for synthesis & STA
- Self-checking RTL test-bench on referenced vectors
- Documentation

For other AES solutions, please see dedicated product sheets: **AES Multi-Purpose** (BA411e), **AES-GCM Multi-Booster** (BA415) and **AES-GCM Ultra-Low Latency** (BA415LL)

AES Crypto Engines

Encrypts the plain text (source data) into cipher text (encrypted data) and sends it to the NAND flash for storage.
